REIN METAL COOLING UPGRADES FOR LAND ROVER & JAGUAR

Data available through Activant/Epicor, WHI, or ShowMeTheParts.com

CRP Automotive is expanding its line of Rein upgraded metal cooling system components with a new range of premium-quality parts for Jaguar and Land Rover applications equipped with 3.0L V6 and 5.0L V8 supercharged and naturally aspirated engines. These high-performance engines are known for cooling system vulnerabilities, where factory-installed plastic components such as coolant pipes, housings, and connectors are prone to cracking, warping, and premature failure under heat and pressure.

Rein's upgraded solutions replace these failure-prone plastic parts with direct-fit metal alternatives designed to improve durability, heat resistance, and service life. By addressing the root cause of common cooling system failures, these components help prevent repeat repairs, reduce downtime, and keep these engines operating as intended.

Water Hose Upgrades (P/N CHU0638, CHU0639)

Rein upgraded water hoses are designed with an integrated brass connector to replace the failure-prone plastic elbow connector. This durable solution helps prevent leaks and ensures long-lasting performance. Hose clamp retaining clips are included for quick and easy installation.

Coolant Pipe Upgrades (P/N CHU0862, CHU0863, CHU0908, CHU0910)

Rein upgraded coolant pipes use aluminum construction in place of the original plastic welded design, which is prone to premature failure. As direct-fit replacements, they install without modification and perform better under heat and pressure.

Thermostat Assembly Upgrades (P/N CTU0049, CTU0082)

Rein upgraded thermostat assemblies use aluminum housings and match original specifications for fit and function. Each unit is calibrated to maintain proper operating temperature while addressing common failure points found in the original plastic designs.
